

BREAK AND CONTINUE

1. BREAK:

1. Break on specific number

Write a program that prints numbers from 1 to 10, but **stops** when the number 7 is reached.

2. Find first even number

Write a program that reads 5 numbers from the user and **stops reading** if any number is **even**. Print "Even number found, stopping".

3. Guess the number

Write a program where the user has to guess a number between 1 and 10. If the guess is correct, print "Correct!" and break the loop. Allow unlimited tries until they get it right.

4. Print until multiple of 5

Print numbers starting from 1 and break when you find a number that is a **multiple of both 5 and 3** (i.e., 15, 30, etc.).

5. Break in a loop with user choice

Keep asking the user to enter a number. If the user enters **-1**, break the loop and print "You chose to exit".

2. CONTINUE:

1. Print numbers from 1 to 10, but **skip** the number 5 using **continue**.

2. Write a program to print all **odd numbers** from 1 to 20. Use **continue** to **skip even numbers**.

3. Ask the user to enter 5 numbers. If a number is **negative**, skip it using **continue**, and only print positive ones.

4. Print numbers from 1 to 30. **Skip** numbers that are divisible by 3 using **continue**.

5. Take 5 numbers as input. If the user enters 0, **skip** it using **continue**. At the end, print the **sum of all non-zero numbers** entered.
